

# 一、查询医院接口

参考《尚医通API接口文档.docx》业务接口4.4查询医院

## 1、复制Result返回结果类

复制到common\_utils

## 2、添加service方法

```
1  /**
2   * 查询医院
3   * @param hoscode
4   * @return
5   */
6  Hospital getByHoscode(String hoscode);
7
8  @Override
9  public Hospital getByHoscode(String hoscode) {
10     return hospitalRepository.getHospitalByHoscode(hoscode);
11 }
```

## 3、添加controller

```
1  @ApiOperation(value = "获取医院信息")
2  @PostMapping("hospital/show")
3  public Result hospital(HttpServletRequest request) {
```

```
4      Map<String, Object> paramMap = HttpRequestHelper.switchMap(request.getParameterMap());
5      //必须参数校验
6      String hoscode = (String)paramMap.get("hoscode");
7      if(StringUtils.isEmpty(hoscode)) {
8          throw new YyghException(20001, "失败");
9      }
10     //签名校验 略
11     Hospital hospital = hospitalService.getByHoscode(hoscode);
12     return Result.ok(hospital);
13 }
```
