一、Swagger2介绍

前后端分离开发模式中,api文档是最好的沟通方式。

Swagger 是一个规范和完整的框架,用于生成、描述、调用和可视化 RESTful 风格的 Web 服务。

- 1. 及时性 (接口变更后, 能够及时准确地通知相关前后端开发人员)
- 2. 规范性 (并且保证接口的规范性,如接口的地址,请求方式,参数及响应格式和错误信息)
- 3. 一致性 (接口信息一致,不会出现因开发人员拿到的文档版本不一致,而出现分歧)
- 4. 可测性 (直接在接口文档上进行测试,以方便理解业务)

二、配置Swagger2

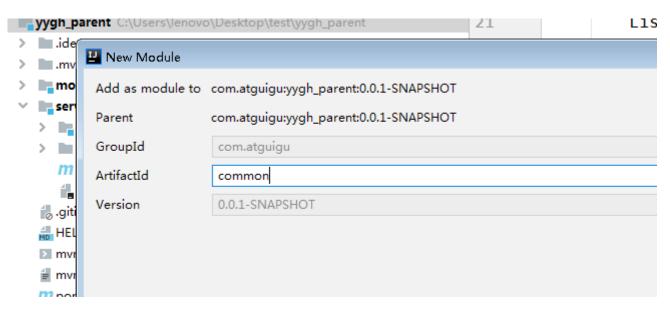

1、创建common模块

在yygh_parent下创建模块common

配置:

groupld: com.atguigu

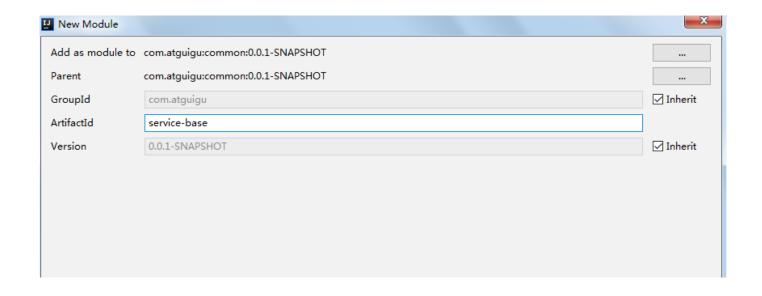

artifactId: common

2、在common中引入相关依赖

```
<dependencies>
 2
       <dependency>
 3
           <groupId>org.springframework.boot
           <artifactId>spring-boot-starter-web</artifactId>
 4
 5
           <scope>provided </scope>
       </dependency>
 6
 7
       <!--mybatis-plus-->
 8
9
       <dependency>
           <groupId>com.baomidou
10
           <artifactId>mybatis-plus-boot-starter</artifactId>
11
           <scope>provided </scope>
12
       </dependency>
13
14
       <!--lombok用来简化实体类: 需要安装lombok插件-->
15
       <dependency>
16
           <groupId>org.projectlombok</groupId>
17
           <artifactId>lombok</artifactId>
18
       </dependency>
19
20
21
       <!--swagger-->
22
       <dependency>
           <groupId>io.springfox</groupId>
23
           <artifactId>springfox-swagger2</artifactId>
24
25
       </dependency>
       <dependency>
26
27
           <groupId>io.springfox</groupId>
           <artifactId>springfox-swagger-ui</artifactId>
28
29
       </dependency>
30
31
       <dependency>
32
           <groupId>com.alibaba/groupId>
           <artifactId>fastjson</artifactId>
33
       </dependency>
34
35 </dependencies>
```

3、在common下面创建子模块service_utils

3、在模块service-base中,创建swagger的配置类

创建包com.atguigu.yygh.common.config, 创建类Swagger2Config

```
1 @Configuration
 2 @EnableSwagger2
  public class Swagger2Config {
 3
 4
       @Bean
 5
       public Docket webApiConfig(){
           return new Docket(DocumentationType.SWAGGER_2)
 6
 7
                    .groupName("webApi")
 8
                   .apiInfo(webApiInfo())
 9
                   .select()
                   //只显示api路径下的页面
10
                   //.paths(Predicates.and(PathSelectors.regex("/api/.*")))
11
                   .build();
12
13
       }
14
15
       @Bean
       public Docket adminApiConfig(){
16
           return new Docket(DocumentationType.SWAGGER_2)
17
                   .groupName("adminApi")
18
19
                   .apiInfo(adminApiInfo())
                   .select()
20
                   //只显示admin路径下的页面
21
                   .paths(Predicates.and(PathSelectors.regex("/admin/.*")))
22
                   .build();
23
24
       }
25
```

```
private ApiInfo webApiInfo(){
26
27
          return new ApiInfoBuilder()
                  .title("网站-API文档")
28
                  .description("本文档描述了网站微服务接口定义")
29
                  .version("1.0")
30
                  .contact(new Contact("atguigu", "http://atguigu.com", "493211102@qq.c
31
32
                  .build();
33
      }
34
      private ApiInfo adminApiInfo(){
35
          return new ApiInfoBuilder()
36
                  .title("后台管理系统-API文档")
37
                  .description("本文档描述了后台管理系统微服务接口定义")
38
                  .version("1.0")
39
                  .contact(new Contact("atguigu", "http://atguigu.com", "49321112@qq.co
40
                  .build();
41
42
       }
43 }
```

4、在模块service模块中引入service_utils

5、在service_hosp启动类上添加注解,进行测试

```
@SpringBootApplication
@ComponentScan(basePackages = {"com.atguigu"})
public class ServiceHospApplication {
    public static void main(String[] args) { SpringApp.
```

6、通过地址访问测试

本文档描述了后台管理系统微服务接口定义

Created by atquiqu See more at http://atguigu.com Contact the developer

hospital-set-controller: Hospital Set Controller

Show/Hide

[BASE URL: $\emph{/}$, API VERSION: 1.0]

可以添加一些自定义设置,例如:

定义样例数据

```
1 @ApiModelProperty(value = "创建时间", example = "2019-01-01 8:00:00")
2 @TableField(fill = FieldFill.INSERT)
3 private Date gmtCreate;
4
5 @ApiModelProperty(value = "更新时间", example = "2019-01-01 8:00:00")
6 @TableField(fill = FieldFill.INSERT_UPDATE)
7 private Date gmtModified;
```

```
/admin/edu/teacher
GET
Response Class (Status 200)
OK
Model Example Value
 E
     "avatar": "string",
     "career": "string",
      'deleted": false,
     "gmtCreate": "2019-01-01 8:00:00",
      gmtModified": "2019-01-01 8:00:00",
     "id": "string",
     "intro": "string",
     "level": 0,
     "name": "string",
     "sort": 0
   }
```

5、定义接口说明和参数说明

定义在方法上: @ApiOperation

定义在参数上: @ApiParam

```
1 //医院设置接口
 2 @Api(description = "医院设置接口")
 3 @RestController
 4 @RequestMapping("/admin/hosp/hospitalSet")
 5 public class HospitalSetController {
 6
 7
       @Autowired
       private HospitalSetService hospitalSetService;
 8
 9
       //查询所有医院设置
10
       @ApiOperation(value = "医院设置列表")
11
       @GetMapping("findAll")
12
       public List<HospitalSet> findAll() {
13
           List<HospitalSet> list = hospitalSetService.list();
14
          return list;
15
16
       }
17
```

```
18
       @ApiOperation(value = "医院设置删除")
       @DeleteMapping("{id}")
19
       public boolean removeById(@ApiParam(name = "id", value = "讲师ID", required = tru
20
           return hospitalSetService.removeById(id);
21
22
       }
23 }
```

后台管理系统-API文档

本文档描述了后台管理系统微服务接口定义

Created by atguigu See more at http://atguigu.com Contact the developer

hospital-set-controller: 医院设置接口

Show/Hide | List Operations | Expand Operations

/admin/hosp/hospitalSet/findAll

医院设置列表

DELETE /admin/hosp/hospitalSet/{id}

医院设置删除

[BASE URL: \emph{f} , API VERSION: 1.0]
