一、排班详情列表(接口)

选择:

1、添加service接口和实现

根据医院编号 、科室编号和工作日期,查询排班详细信息

(1) 在ScheduleService定义方法

```
1 //根据医院编号 、科室编号和工作日期,查询排班详细信息
2 List<Schedule> getDetailSchedule(String hoscode, String depcode, String workDate);
```

(2) 在ScheduleServiceImpl实现方法

```
1 //根据医院编号 、科室编号和工作日期,查询排班详细信息
2 @Override
  public List<Schedule> getDetailSchedule(String hoscode, String depcode, String workDa
3
      //根据参数查询mongodb
4
      List<Schedule> scheduleList =
5
6
             scheduleRepository.findScheduleByHoscodeAndDepcodeAndWorkDate(hoscode,dep
7
      //把得到list集合遍历,向设置其他值: 医院名称、科室名称、日期对应星期
      scheduleList.stream().forEach(item->{
8
9
          this.packageSchedule(item);
10
      });
```

```
11
      return scheduleList;
12 }
13 //封装排班详情其他值 医院名称、科室名称、日期对应星期
  private void packageSchedule(Schedule schedule) {
14
      //设置医院名称
15
      schedule.getParam().put("hosname",hospitalService.getHospName(schedule.getHoscode
16
17
      //设置科室名称
      schedule.getParam().put("depname",
18
          departmentService.getDepName(schedule.getHoscode(),schedule.getDepcode()));
19
      //设置日期对应星期
20
      schedule.getParam().put("dayOfWeek",this.getDayOfWeek(new DateTime(schedule.getWo
21
22 }
```

2、添加ScheduleRepository方法

```
1 //根据医院编号 、科室编号和工作日期,查询排班详细信息
2 List<Schedule> findScheduleByHoscodeAndDepcodeAndWorkDate(String hoscode, String depc

■
```

3、添加根据部门编码获取部门名称

(1) DepartmentService添加方法

```
1 //根据科室编号,和医院编号,查询科室名称
2 String getDepName(String hoscode, String depcode);
```

(2) DepartmentServiceImpl实现方法

```
1 //根据科室编号,和医院编号,查询科室名称
2 @Override
3 public String getDepName(String hoscode, String depcode) {
    Department department = departmentRepository.getDepartmentByHoscodeAndDepcode(hosif(department!= null) {
        return department.getDepname();
    }
```

```
8 return null;
9 }
```

2、在ScheduleController添加方法

二、排班详情列表(前端)

1、封装api请求

在api/yygh/schedule.js添加

```
1 //查询排班详情
2 getScheduleDetail(hoscode,depcode,workDate) {
3    return request ({
4         url: `/admin/hosp/schedule/getScheduleDetail/${hoscode}/${depcode}/${workDate method: 'get'
5    })
7 }
```

2、页面显示

修改/views/hosp/schedule.vue组件

```
4
               <el-container style="height: 100%">
 5
               <el-aside width="200px" style="border: 1px silver solid">
                   <!-- 部门 -->
 6
 7
                   <el-tree
 8
                   :data="data"
 9
                   :props="defaultProps"
10
                   :default-expand-all="true"
                   @node-click="handleNodeClick">
11
                   </el-tree>
12
               </el-aside>
13
               <el-main style="padding: 0 0 0 20px;">
14
15
                   <el-row style="width: 100%">
                       <!-- 排班日期 分页 -->
16
                       <el-tag v-for="(item,index) in bookingScheduleList" :key="item.ic
17
                           {{ item.workDate }} {{ item.dayOfWeek }}<br/>>
18
                           {{ item.availableNumber }} / {{ item.reservedNumber }}
19
20
                        </el-tag>
21
                       <!-- 分页 -->
22
23
                       <el-pagination
24
                            :current-page="page"
25
                            :total="total"
26
                            :page-size="limit"
27
                            class="pagination"
28
                           layout="prev, pager, next"
29
                           @current-change="getPage">
                        </el-pagination>
30
31
                   </el-row>
32
                   <el-row style="margin-top: 20px;">
33
                   <!-- 排班日期对应的排班医生 -->
35
                   <el-table
36
                           v-loading="listLoading"
                            :data="scheduleList"
37
                           border
38
                           fit
39
                           highlight-current-row>
40
41
                            <el-table-column
                                        label="序号"
42
