一、新增和修改医院设置工具

1、新增

```
1  @ApiOperation(value = "新增医院设置")
2  @PostMapping("saveHospSet")
3  public R save(
4      @ApiParam(name = "hospitalSet", value = "医院设置对象", required = true)
5      @RequestBody HospitalSet hospitalSet){
6
7      //设置状态 1 使用 0 不能使用
8      hospitalSet.setStatus(1);
9      //签名秘钥
10     Random random = new Random();
11     hospitalSet.setSignKey(MD5.encrypt(System.currentTimeMillis()+""+random.nextInt(1
12
13     hospitalSetService.save(hospitalSet);
14     return R.ok();
15 }
```

2、根据id查询

```
1  @ApiOperation(value = "根据ID查询医院设置")
2  @GetMapping("getHospSet/{id}")
3  public R getById(
4      @ApiParam(name = "id", value = "医院设置ID", required = true)
5      @PathVariable String id){
6
7      HospitalSet teacher = hospitalSetService.getById(id);
8      return R.ok().data("item", teacher);
9  }
```

3、根据id修改

```java
@ApiOperation(value = "根据ID修改医院设置")
@PostMapping("updateHospSet")
public R updateById(@ApiParam(name = "hospitalSet", value = "医院设置对象", required =
                    @RequestBody HospitalSet hospitalSet){
    hospitalSetService.updateById(hospitalSet);
    return R.ok();
}
```
